

Flat-Track™

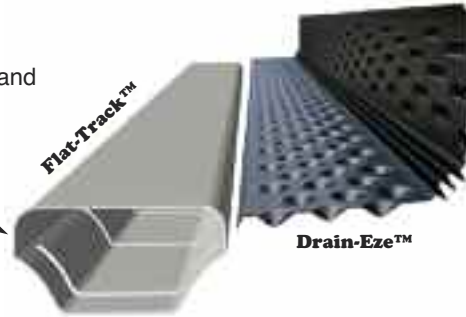

Collects water seepage from where the walls and sub-floor meet

The *Flat-Track™ System* uses fine slits to screen dirt and sand from entering the system. *Flat-Tracks™* can be installed on top or next to the footing.

Drain-Eze™ creates a 3/8" space between the floor and wall that collects seeping water and channels it across the footing to the *Flat-Track™ System*.

Service Ports are installed along main runs for easy access to your *Flat-Track™ System*.

The **NEW Flat-Track™ System** is an ideal remedy to all your water management needs. This unique and innovative design collects water from the two primary sources that are responsible for your basement water leakage.

First, the *Drain-Eze™ System* collects water entering from where the wall meets the footer and then channels the water into the *Flat-Track™ System*.

Next, the *Flat-Track™ System* pulls water from under the concrete slab and directs both sources of water through its main sections towards your sump-pump. *Flat-Track™* channels flow clean and clog-free year after year.

Options & Upgrades

A quality pump is truly the heart of any water management system. Quietly collecting water seepage year after year. The gas-tight sump-pump is the BOSS.

Using a high quality sump-pump system with your basement *Flat-Track™ System* should last you for the life of your home.

Redundancy gives you twice the protection for a small fraction of the job cost. Ask your salesman about the
